

TeX Live with Codex

A concise setup and working guide for HDR candidates

One connected workflow

A local TeX Live compiler lets Codex edit .tex files, compile the document, inspect the log, correct formatting problems and compile again in one workflow.

Availability depends on permissions and configuration of the working environment.

Five-step sequence

1

Check the working environment

Confirm access, permissions and the available TeX Live tools.

2

Prepare the LaTeX project

Locate the root source, supporting files and intended output.

3

Edit approved source

Apply the requested change while preserving approved content.

4

Compile and inspect the log

Build the PDF and review errors, warnings and layout signals.

5

Correct and recompile

Resolve technical problems, rebuild and inspect the new output.

Prompt and responsibilities

A prompt to adapt

Check whether TeX Live is available in this Codex working environment. If it is not, explain whether a project-managed installation is permitted. Then open main.tex, compile it, inspect the log, correct formatting or compilation errors without changing approved wording, citations or numerical results, and recompile. Report any unresolved journal or template requirements.

Technical checks and researcher checks

What Codex can check technically

- TeX Live availability in the working environment
- source structure and package errors
- compilation log errors and warnings
- page layout, clipping and legibility
- a successful recompile after corrections

What the researcher must check

- approved wording and argument
- citations and attribution
- numerical results and interpretation
- journal or template requirements
- academic judgement and final sign-off

Successful compilation confirms technical consistency only; academic judgement remains with the researcher.
